not only of subjective phenomena but also of measurable deficits such as visual field defects. The psychological study is weakened by the inadequate technique used to measure memory functions (digit span, naming four presidents, and serial sevens) and by the lack of data concerning specific cognitive impairment in relation to the site of the lesion. The wealth of pathological scores on the Minnesota multiphasic personality inventory adds little whereas an analysis of the differential effects of right and left hemisphere lesions might have contributed to present knowledge of the asymmetry of cerebral functioning.

SAMMLUNG ZWANGLOSE ABHANDLUNGEN AUS DEM GEBIETE DER PSYCHIATRIE UND NEUROLOGIE.
Heft 25. ERWEITERUNGEN DES SPINALRAUMES. Radiologische Beurteilung unter besonderer Berücksichti

This is a most useful study of the normal capacity of the spinal canal at all levels and of the significance of in
creased measurements.

ANATOMY FOR ANAESTHETISTS By Harold Ellis and
Margaret McLarty. (Pp. xi + 340; 174 figures. 45s.)
This book provides concise information with excellent diagrams regarding those aspects of anatomy of VERTE-
BRAE, muscles, arteries, veins and peripheral nerves, which the neurologist requires to know about as well as the anaesthetist.
