cannot be excluded. Allele association studies are hampered by several possible sources of error. Our study emphasises the need for additional, carefully designed studies when applying this potentially useful method in the search for genetic factors contributing to the aetiology of Parkinson's disease.

The study was supported in part by the Bundesministerium für Bildung und Forschung, Germany (Research program on Parkinson's disease and other basal ganglia disorders, grant No 01KL9001).

The Marcus Gunn pupil.
