Depression...disturbed sleep...

Sinequan®
brand of doxepin
* Trade Mark

lifts depression...
promotes restful sleep

■ SEDATIVE ANTIDEPRESSANT
■ ONCE NIGHTLY DOSAGE

Indications: depression with or without anxiety. Contraindications: glaucoma, urinary retention, hypersensitivity to the drug. Side effects: dry mouth and drowsiness are most commonly reported. Precautions: Sinequan may potentiate other compounds—e.g. monoamine oxidase inhibitors: not recommended in pregnancy or children under 12 years age. Dosage: range 30 mg to 300 mg daily in divided doses, up to 100 mg may be given as a single dose at night. Packs and Basic N.H.S. Cost: 10 mg capsules (PL 57/5032), pack of 100, £2.98; 25 mg capsules (PL 57/5033), pack of 100, £3.24; 50 mg capsules (PL 57/5034) pack of 100, £7.01; 75 mg capsules (PL 57/0133), pack of 60, £6.64.

Full information on request to the Company.

Pfizer® PFIZER LIMITED
The Institute provides postgraduate training in the various departments of Neurology.

The Out-Patient Practice is open at 10 o'clock at QUEEN SQUARE every day (except Saturday). A fee of £180 per month is charged for attending the Out-Patient Department only.

The In-Patient Practice at Queen Square is open at 10 a.m., and a limited number of clinical clerks are appointed. Fees: three months £1,250, six months £2,500.

Whole-time courses of instruction are given during the Autumn, Winter and Spring terms. Besides these, teaching in the various neurological disciplines goes on throughout the year together with Clinical Demonstrations every Wednesday afternoon and Saturday morning as advertised in the Medical Journals.

Application should be made to the Dean at the Institute, Dr. P. C. GAUTIER-SMITH

Fibrinolysis and its Inhibition

The Proceedings of a Symposium organised by the Royal College of Pathologists

Edited by J. F. Davidson

Scientific basis—Biological role of fibrinolysis • Biochemistry of the plasmin system • Breakdown products of fibrin and fibrinogen: molecular mechanisms and clinical implications • Plasminogen activators: a morphologist's view • Natural inhibitors of fibrinolysis • Pathophysiology of intravascular coagulation and fibrinolysis • Therapeutic considerations—Basis of antifibrinolytic therapy • Clinical pharmacology of aminocaproic and tranexamic acids • Assessment of inhibitors with chromogenic substrates • Clinical applications—Inhibitors of fibrinolysis in the treatment of haemophilia • Clinical applications of fibrinolytic inhibition in gynaecology • Antifibrinolytic therapy in genitourinary tract surgery • Fibrinolysis and gastrointestinal haemorrhage • Tranexamic acid (AMCA) in aneurysmal subarachnoid haemorrhage • Adjuvant treatment of ovarian carcinoma with tranexamic acid • Future prospects for use of fibrinolysis inhibitors.

Price: Inland £5.00; Abroad US$12.50, including postage

Payment must be enclosed with order or a surcharge of 50p will be made for rendering invoices and statements

A new generation of Micra Titanium Instruments.

Downs Surgical's new range of Micra titanium forceps offers advances in design and quality with a complete choice of delicate tips. This new generation of Micra titanium forceps incorporates the requests for improvement revealed in a world-wide survey of Micra Instrument users. Now these improvements are made possible due to our improved titanium technology. Straight, curved and colibri forceps are available with tying platforms on tying, notched and toothed tips or as plain forceps.

For full details just return the coupon.

CELLOLITE™ SURGICAL SPONGES

CELLOLITE™ is a white, synthetic, X-Ray detectable sponge designed to overcome all the drawbacks of conventional absorbent materials.

The main characteristics of CELLOLITE™—its extreme softness and high degree of conformability, its rapid wicking rate and high absorbency capacity, its overall X-Ray opacity and fibre-free nature—all serve to ensure that CELLOLITE™ is the only really safe and efficient sponge for Neurosurgery.

In short, no other material can match the properties of CELLOLITE™.

Why struggle on using the same old fibrous pattie when you can take a giant step forward with CELLOLITE™? In these days of Space Age surgical techniques why 'make do' with conventional patties?

Use CELLOLITE™ Surgical Sponges, the product born out of Space Age technology, and benefit from the superior properties of a sponge with the needs of the Twenty-first Century in mind.

Benefit from the softness and non-abrasive character, the overall X-Ray opacity possible due to 'state of the art' encapsulation of Barium Sulphate particles chemically bonded to the sponge, and, so important in delicate surgery, the fibre-free nature of CELLOLITE™ which guarantees that no fibres can be shed into the wound, virtually eliminating the risk of granulomas etc. which are a hazard when using conventional patties.

What other product can offer so much?
Use CELLOLITE™ the ideal Neurosurgical Sponge.

ENZYMES AND NEUROTRANSMITTERS IN MENTAL DISEASE

Based on a Symposium held at the Technion Faculty of Medicine, Haifa, Israel: August 28-30, 1979

edited by Earl Usdin, National Institute of Mental Health, Rockville, Maryland, USA,
T.L. Sourkes, McGill University, Montreal, Quebec, Canada,
and M.B.H. Youdim, Technion-Israel Institute of Technology, School of Medicine, Haifa, Israel

In the last ten to fifteen years research in biological psychiatry has increasingly demanded the skills and interests of neuroscientists. This volume presents some of the most recent developments in this field, by bringing together a large number of investigators who work in the basic biomedical sciences and who are motivated by an important commitment to furthering our knowledge of the basis for mental disease.

The contributors offer a unique emphasis on the interactions of enzymes and neurotransmitters with psychiatric and model states. The research in biochemical psychiatry described here clearly affirms the relevance of basic science investigations to the solution of problems of psychiatric disease.

As well as giving up-to-date research results, this book stresses state-of-the-art reviews. In some cases, there is disagreement between authors, but the editors feel this is as it should be, since some areas are still in a state of flux and readers should be informed of the different positions of the leading researchers.

**Presentations**
(1) Lilac-coloured enteric coated tablets containing 200mg or 500mg sodium valproate (Epilim 200 enteric coated/Epilim 500 enteric coated).
(2) Red cherry-flavoured syrup containing 200mg sodium valproate per 5ml (Epilim Syrup).

**Indications**
Epilepsy. In women of childbearing age, Epilim should be used only in severe cases or those resistant to other treatment.

**Dosage and Administration**
To be taken with or after food; tablets should be swallowed whole.
Adults: Initially 600mg/day in divided doses, increasing by 200mg/day at three-day intervals until control is achieved (maximum dose 2600mg/day).
Children over 20kg: Initially 400mg/day in divided doses, with spaced increases until control is achieved (usually in the range of 20-30mg/kg/day).
Children under 20kg: 20mg/kg/day, with spaced increases until control is achieved, up to a maximum of 50mg/kg/day.
Plasma levels of 200µg/ml should be exceeded only with caution and with monitoring of haematological function.

**Contra-indications,Warnings, etc.**
There are no absolute contra-indications.

**Side-effects:** Minor gastric irritation and nausea have been observed in some patients at the start of treatment with uncoated tablets, but this can usually be overcome by using the enteric coated tablet, or relieved by standard medication.
Transient hair loss has occurred in some patients; tremor, occasionally seen at high dosages, may be controlled by reduction of dosage. Oedema has been reported. Reversible prolongation of bleeding time and thrombocytopenia have been reported, but usually at doses above those recommended. Spontaneous bruising or bleeding is an indication for withdrawal of medication pending investigation. Patients receiving Epilim should be monitored for platelet function before major surgery.

Liver dysfunction, including hepatic failure resulting in fatalities, has occurred in a few patients whose treatment included Epilim. These incidents occurred during the early months of treatment. Although a causal relationship has not been established, it is recommended that liver function be investigated prior to commencing therapy and monitored at two-monthly intervals thereafter for up to six months. Should liver dysfunction be suspected, immediate withdrawal of the drug is indicated, prior to full investigation of the possible causes. Caution should be exercised when administering Epilim to patients with pre-existing liver disease.

**Combined medication:** When adding Epilim to existing anticonvulsant medication, e.g. barbiturates, the sedative effects of the latter may be enhanced, and it may therefore be necessary to reduce their dosage. As Epilim may potentiate the effect of mono-amine oxidase inhibitors and other antidepressants, dosage of such compounds should also be reduced.

**Diabetic patients:** Epilim may give false
Mozart, in his Clarinet Quintet,
achieved harmony with a balance
of 4 + 1.

Roche, with Madopar, struck the
right balance of 4 + 1 with levodopa and
the decarboxylase inhibitor
benserazide. Chosen from several
ratios as the one giving the best results
in clinical practice, this combination
has proved its rightness over a decade
of clinical experience.

The 4 + 1 preparation of levodopa
and benserazide has recently added
another string to its bow. In a
comparative trial it was shown to be
preferred by patients to a 10 + 1
preparation of levodopa and carbidopa
because of its better gastro-intestinal
tolerance in the critical first three
months of treatment.

Madopar
levodopa plus benserazide
balanced for
optimal performance in
Parkinson's disease

Something Wrong

Diazepam is indicated for the relief of spasticity in multiple sclerosis, other spinal lesions, and also for the treatment of spasticity of cerebral origin in children and young adults (under 20 years of age). Dosage is advisable to commence treatment with 1 mg by slow daily increase to the desired effect. Adjustment of dosage is necessary to suit the individual patient. A maximum daily dose of more than 10 mg per day is rare until the patient is under close supervision. There have been reports of fatal reactions, especially in debilitated patients, in association with diazepam, which suggests that it should be used with care in debilitated patients.

The combination of simple language and straightforward line drawings has made the

ABC OF OPHTHALMOLOGY

one of the most popular series of articles in the Medical Practice section of the British Medical Journal.

All the common problems are covered - visual defects, squints, glaucoma and cataracts - together with detailed instruction on examination, diagnosis and management.

The articles have now been collected into book form - in exactly the same format as they appeared in the BMJ - price: Inland £2.50; Overseas US$6.25 (Inland £2.00; Overseas US$5.00 for BMA members).

Epidemiology for the Uninitiated

Do you know the difference between the incidence of a disease and its prevalence? How to set up a valid controlled trial? How to plan and conduct a survey? Many doctors would like to carry out some simple clinical research but find they lack basic information of this kind. The answers were published in 1978-79 in a series of BMJ articles, now collected together in book form—essential reading for anyone contemplating starting a research study.

BRITISH COUNCIL MEDICAL COURSE

HEAD INJURIES

6-18 September 1981 in GLASGOW

The aim of this course is to review current knowledge concerning head injuries. It will be held at the University of Glasgow’s Institute of Neurological Sciences, the head injury centre for the West of Scotland. The Directors of Studies will be Professor B. J. Jennett and Mr G. M. Teasdale of the Department of Neurosurgery. The course is primarily for clinicians concerned with the management of head injuries. Neuropathologists and basic scientists will describe the lesions found in fatal cases, the dynamic pathophysiological processes which follow injury and will review experience with experimental injuries. Methods of clinical assessment, neuroradiological diagnosis including CT scanning, and monitoring methods will be discussed and demonstrated. Treatment will be dealt with by neurosurgeons, anaesthetists and others directly involved. Assessment of prognosis and its value as a method of determining the efficacy of treatment will be described. It will also cover areas such as epidemiological aspects and the analysis of local needs for the provision of a service for head injuries. Discussion and debate will be encouraged and members of the course will be expected to contribute their views and experience. This course is intended for experienced neurosurgeons as well as for anaesthetists and other surgeons who have a major responsibility for the care of patients with head injuries.

There are vacancies for 30 members.
Fee fully inclusive £595.
Applications must be received in London by 15 April 1981.

Further information and application forms may be obtained from local overseas Representatives of The British Council or from the Director, Courses Department, The British Council, 65 Davies Street, London W1Y 2AA. Tel. 01-499 8011.
