Book reviews

Hysteria discusses ganglia: sympathetic deduces the problem by mind-body and lived and operated and held in fear of bankruptcy. He was a founder physician of the Adelaide Hospital, and gave the first ether anaesthetic in Southern Australia, to a patient who underwent a neck operation for carcinoma. He was grand master of the Freemasons order, and died unexpectedly after a successful cataract operation. I enjoyed this book and commend it. It is written with charm and an eye for detail, and with the skill, interest and the precise thoroughness which one would expect from careful neurosurgery.

JR HERON

Time was, when the more cerebral neurologists on the London scene, after a search of the literature, current neurological texts and their own experience would prepare their personal textbook of neurology. Most books were composed by the individual, without an author or manuscript reader, each were given what was deemed to be a title suitable for the aims of the work. Thus we had Textbooks of Neurology, Essentials, Aids and many "Disorders of the Nervous System", with one long-term runner.

It has become the fashion for almost all neurologists practising in the "academic environment" to consider a title, a new format, a new model, a lone author, and approach to the diagnosis and management of patients with neurological disease.

We now have another handbook of neurology which makes no claim to rival its ancestral 40 volume equivalent, but asserts a usefulness to specialists in other fields, neurologists in training, primary health care physicians and perhaps medical students. This is a book which does not attempt to address the problems of neurochemistry, neurophysiology, molecular biology nor immunology but considers simple neuroanatomy and disorders of importance and high incidence in the United Kingdom.

The author's approach is different from that in the traditional textbook. He divides his material by symptom headings and a general classification of neurological disease and peppers the text with lists, saving considerable space and sparing literary effort. We are given, for example a list of 52 drugs known to cause seizures. If you prefer lists to prose then this book should attract you.

Written in New Zealand during sabbatical leave and with a script scrutinised by 25 of Professor Warlow's peers, the book presents a refreshingly unconventional approach to the material. It is succinct, readable and at times, capriciously provocative.

It has been said elsewhere that the major scientific advance in recent neurological practice has been the computer. The author considers the telephone to be the most important instrument at our disposal, but does not include it in his index!

As a short book of reference I feel that this true "handbook" will be very successful, but who is next and what will be new?

JB FOSTER

Sir Hugh Cairns, one of the three pioneers of specialised neurosurgery in Britain, died in 1952, at the age of 54. His influence spread far beyond these shores and it is appropriate that his biography should have been written by Professor Franklen, first encounter with Cairns was as a student in Oxford and whose career encompassed New Zealand and Australia.

Cairns was born in South Australia. His first venture abroad was as an orderly in the AAMC on the island of Lemnos during the Gallipoli campaign. He then returned home, completed medical qualification and was awarded a Rhodes scholarship. Before taking this up he served as a medical officer on the Western front. His initial stay in Oxford was eventful: work with Sherrington, a roving blue and engagement to be married. He was increasingly drawn towards surgery and held junior posts at St Bart's and the London Hospital, eventually being appointed to the honorary staff. The turning point in his career was the award of a Rockefeller Scholarship to work under Harvey Cushing.

It is evident from his letters home that Cairns greatly admired Cushing's surgery but much disliked the man. Anyone who worked with Cairns will recognise the irony of his comparison with the great neurosurgeon of Boston. The account of the subsequent struggle to establish himself as a neurosurgeon in the now almost unrecognisable world of the voluntary hospitals of London makes fascinating reading. Needless to say, he was successful for, as Professor Gardner wrote: "he was constitutionally unable to give up any project on which he had set his mind and heart!"

Cairns' vital role in the establishment of the Oxford clinical medical school, although originally intended for post-graduates, is well known and is here fully described. This was immediately followed by the outbreak of war. Cairns' influence on the treatment and prevention of head wounds was extensive and included St Hugh's head injury hospital, the organisation of mobile neurosurgical units in the field, and insistence on an effective helmet for dispatch riders.

The biographer must steer a narrow course between too much and too little detail and perhaps Franklen has erred a little in the former direction. In the profusion of names and dates it is difficult to recapture the atmosphere of the Nuffield of early days: the devoted but often exhausted house surgeons striving far into the night to write notes of the meticulous standard demanded in a room dominated by a gigantic Bjerrum's screen: the Monday ward round with Cairns full of vigour to the end while all else wilted: the stern reproof for not testing the sense of smell in a patient with a spinal tumour. "Better get it done, boy".

Hugh Cairns was a man of immense determination and energy whose personality attracted others to work enthusiastically with him in surgery, neurology, pathology, radiology and anaesthetics, but none worked as hard as he did himself. Was he a good surgeon? He, apparently, didn't think so. He was certainly remarkably slow and not notably equable in the theatre. I have still vivid memories of having the privilege of assisting him while a medical student and being sharply reminded that he was a brain and not plasticine that we were handling.

When he knew he was dying Cairns' reaction was one of anger that his plans for future work would not be completed. His achievements, amply documented by Gus Franklen, were already sufficient to satisfy most mortals.

WB MATTHEWS

One of the accepted definitions of the word "principle" is that it is a fundamental basis from which other actions or conclusions may be derived. This book is therefore somewhat mis-named since it is indeed a review of a very wide series of neurological conditions, some of which are dealt with in considerable detail, while others are only briefly addressed. In any multi-author text book the standard of the contributions is somewhat variable and often reflects the particular interests of the individual concerned.

Thus, in the first chapter on Anaesthesia Dr Albin's concern with Brain Retractor Pressure leads to a summary of some excellent work which he and his group have performed, and is of great interest. On the other hand it is somewhat doubtful whether the chapters on Congenital and Developmental Cranial Abnormalities and Primary Diseases of the Skull, both of which are extremely brief, should be included in a book claiming to address itself to fundamental principles of neurosurgery. The chapter on Spontaneous Intracerebral Haematomas fails to mention cavernoma, and the description therefore of Brainstem Haematomata is incomplete and by present standards inaccurate. In the same way, the coverage of the complications of Traumatic Aneurysms, of Brain Tumours is quite remarkably patchy. Thus Olfactory
