

l'expression aboutissant à une sorte de tour de Babel.' are groundless: the text covers a wide field in a consistently lucid style.

The book is divided into three parts. The first addresses fundamental aspects of the histology, immunology, biochemistry and physiology of peripheral nerves; the basic pathological mechanisms underlying demyelination and degeneration; the analysis of biopsied nerves, including details of morphometric analysis and the examination of teased fibres. Introductory chapters are necessarily brief. However, in places treatment of a topic is perhaps too superficial; e.g. the omission of reference to NANC nerves in the section on the autonomic system is surprising.

The second part is dedicated to detailed descriptions of neuropathies, with emphasis on their classification, pathophysiology, clinical characteristics and treatment. Frequent use of tables is a helpful feature of the text. There are nineteen major chapters, each dealing with a specific group or type of neuropathy.

The third part contains chapters on neuropathies seen ... 'dans certains contextes plus particuliers.' Topics covered are neuropathies in young children and in old age; dysautonomic polyneuropathies; hypertrophic neuropathies; neuropathies associated with vasculitides and with carcinomas. The book closes with neuropathies in domestic animals.

The bibliography, almost exclusively in English, is comprehensive up to 1990, but there are few references beyond this date. The sparing use of photomicrographs is unfortunate. Moreover, those that are included are uniformly pale and rarely labelled. Some of the electron micrographs can only be appreciated using a magnifying glass and in a good light! The paucity of illustrations is a serious deficit in what is otherwise a most useful hand book.

SUSAN HALL

Handbook of Tourette's Syndrome and Related TIC and Behavioral Disorders. (Neurological Disease and Therapy Series/15). EDITED BY ROGER KURLAN (Pp 530 Illustrated; Price: \$165.00) 1993. New York: Marcel Dekker, Inc. ISBN 0-8247-8787-0

Once thought to be an excessively rare oddity, Tourette's syndrome may be the commonest of all movement disorders, although prevalence estimates vary hugely from five to 500 per 100,000. It also has the richest symptomatology, not only of sometimes bizarre and improbable movements, utterances and their urges, but also of disordered childhood behaviour or obsessive-compulsive disorder (which can be the only manifestation of the Tourette gene, particularly in females). However, until recently only four books had been published on this condition.

Now, like London buses, two more have appeared within months of each other (this Handbook, and the Advances Vol. 58 reviewed in April). Both are good, both in my view prohibitively expensive for most individuals (\$165.00 and \$145.00 respectively), and there is considerable overlap of authors and subjects (and occasionally of text, not even lightly scrambled by the w.p.m? paligraphia) between the books. Also, a lot of repetition within them, which

could perhaps have been edited down more tightly in the Handbook format to give a shorter and more focused product; indeed one or two of the 29 chapters would not be greatly missed. Nonetheless, the Handbook is the more comprehensive offering, with extensive coverage of the whole range of motor and psychic aspects, and what is known of their neurobiology, genetics, epidemiology and treatment. This is an invaluable reference book, but too highly priced for private purchase.

NIALL QUINN

Pediatric Epilepsy: Diagnosis and Management. EDITED BY W E DODSON AND J M PELLOCK. (Pp 446; Price: \$89.95). 1993. New York: Demos Publications. ISBN 0-939957-33-7

Most people with epilepsy experience the onset in childhood or adolescence. This welcome book of 37 chapters is written by 43 authors from the USA, and Michael Trimble is the first major newcomer of the nineties.

Growth in knowledge of pathophysiology is reviewed: brain structure, neural interconnections, ion channels, membranes and molecules and the metabolic and pharmacological consequences of seizures. Congratulations are due to Dreifuss for a readable chapter on classification and to Prensky for a stimulating clinical chapter on non-epileptic paroxysmal disorders. The accounts of epidemiology, neurophysiological investigation and neuroimaging are compact although the last is sparsely illustrated. Good descriptions of many of the major epileptic syndromes conclude the first half.

Management is discussed in terms of drug therapy rather than educational care. There are differences between drugs used in the USA and in Europe. A chapter on new drugs is interesting. Some are not yet used in Europe.

Though there are chapters on epilepsy and IQ and on behavioural and cognitive aspects, there is little sense of the young person's experience of epilepsy, the importance of the impact on the family or the high frequency of associated disabilities. Nonetheless, the book is clear, scholarly and well referenced.

IAN MCKINLAY

Behavioral Neurology. (100 Maxims in Neurology/Vol. 1). By ORRIN DEVINSKY. (Pp 384; Price: £24.50). 1993. Sevenoaks: Edward Arnold. ISBN 0-340-53619-5

Don't let the title of this book deceive you into believing this is a work devoted to neuropsychology or neuropsychiatry. It is very much a neurologist's text, comprising 100 short sections on a variety of cerebral disorders, their recognition, significance and treatment. The main areas covered are mental status, delirium, aphasia, amnesia and the familiar triad of alexia, agraphia and apraxia. There are sections on visual processing, the syndromes of the right hemisphere, frontal, parietal and temporal lobes as well as chapters on epilepsy, head injury, psychiatric disorders and movement disorders.

The text is liberally peppered with excellent charts, schemata, case reports and, exceptionally nowadays, a selective and pertinent list of references. The writing is clear and explicit. For one author to have mastered and digested such a huge area of neurology and to have presented it so plainly is a considerable achievement. I am unaware of any modern comparable text, and strongly commend it to all clinical neurologists and especially to their disciples.

JMS PEARCE

Neurological Manifestations of Systemic Diseases in Children (The International Review of Child Neurology). By A STEINBERG and Y FRANK. (Pp 387; Price: \$119.00). New York, Raven Press, 1992. ISBN 0-88167-978-X.

This book covers the neurological manifestations of paediatric systemic diseases. It is suggested that it will compliment the general paediatric textbook that deals mainly with systemic manifestations of disease and the paediatric neurology textbook.

The aim is to assemble and summarise current knowledge and data. It is written specifically for the General Paediatrician, the Paediatric Specialist and the Neurologist.

The contents are arranged in the same way as standard paediatric textbooks listing common neurological complications (including sections on pathophysiology, neuropathology, clinical manifestations, and treatment) of nutritional deficiencies, rheumatic diseases, bacterial and viral infections, gastrointestinal and hepatobiliary diseases, renal disease and cardiac and endocrine diseases. Each chapter is followed by an extensive list of references. It is easy to read and informative and could certainly be a ready reference when one is presented with an unusual problem.

The forward states that in these days of technology child neurology remains one of the specialities where good clinical skills are important, as is a thorough knowledge of general paediatrics. This book will go a considerable way to achieving these ideals.

MJ NORONHA

Non-Epileptic Seizures. Edited by AJ ROWAN and JR GATES. (Pp 296; Price: £70.00). Oxford, Butterworth-Heinemann, 1993. ISBN 0-7506-9415-7.

This multi-author text is about pseudo-seizures, other types of paroxysmal events such as syncope and night terrors, for example, receiving only passing reference. Many chapter authors begin by suggesting that between 8% and 20% of those referred to special epilepsy units have non-epileptic seizures. However, a point that is not generally recognised in the book is the number of centres that such patients tend to visit, which will inflate the impression of the frequency of the condition.

Some authors attempt to identify clinical criteria that might be useful in distinguishing true epileptic and pseudoseizures from each other, most acknowledge the substantial degree of behavioural overlap. For example, seizures originating in the frontal lobe or supplementary motor area may have
