Desirable properties for instruments assessing quality of life: evidence from the PDQ-39

de Boer et al describe the development of a Dutch instrument to measure quality of life in patients with Parkinson’s disease. Two important properties that such instruments need to have are not given attention in their study. Questionnaires should produce reproducible data in the sense that they yield the same results in repeated trials under the same conditions and they need to be responsive in the sense that they detect clinically significant changes over time.

We developed a 39 item questionnaire—the PDQ-39—to assess health related quality of life in patients with Parkinson’s disease. A sample of 223 patients were asked to complete the questionnaire on two occasions three days apart. A group of 56 patients were omitted from analysis for reasons of reproducibility because they reported that their health changed over this time period. In the remaining 167 stable patients reproducibility for the eight scales of the PDQ-39 was very satisfactory when expressed as correlation coefficients: mobility 0.94, activities of daily living (ADL) 0.93, emotional well-being 0.90, stigma 0.90, social support 0.68, cognitions 0.86, communication 0.86, and body discomfort 0.80.

How far are we in understanding the cause of Parkinson’s disease?

The article by Ben-Shlomo is excellent although the issue of prevalence of Parkinson’s disease in the black population is only briefly mentioned. We have been studying the pattern of parkinsonism in AfroCaribbean and Indian (originating from the Indian subcontinent) subjects living in London and believe parkinsonism may be commoner in these ethnic groups than previously recognised. Using a door to door assessment of parkinsonism in one electoral ward in London with a high AfroCaribbean population and reviewing the case files of 150 consecutive patients attending movement disorders and general neurology clinics at King’s College, Lewisham and Hammersmith Hospitals we identified 18 cases of parkinsonism in patients of AfroCaribbean and Asian origin.14 Out of 18 (83.3%) cases have non-familial atypical parkinsonism, much higher than an expected 20%–30% in the white population. Our preliminary findings suggest that parkinsonism is probably more common than realised in the AfroCaribbean and Asian populations and these patients may be more susceptible to atypical parkinsonism. The reason for this is unclear and may reflect genetic or environmental factors as has been postulated in relation to the higher incidence of diabetes and ischaemic heart disease in migrant Asian populations in the United Kingdom. Further epidemiological studies on this issue are required.

1 Ben-Shlomo Y. How far are we in understanding the cause of Parkinson’s disease? J Neurol Neurosurg Psychiatry 1996;61:5-16.

Primary malignancies of the central nervous system are uncommon, representing only about 1% of all primary cancers. However for those involved with their management they present fascinating and often frustrating features. There has long been a need for a good reference text on these tumours. This new book, edited by a distinguished American neuro-oncologist, has gathered together a large team of coauthors from many of the main cancer centres in the United States. They have produced a volume which goes a long way to filling that need.

Multiauthorship can result in many problems. This book has avoided most of the traps by assembling teams of surgeons, neuro-oncologists, pathologists, and others who clearly get their contributions together. References are reasonably up to date with some as late as 1994. They are generally comprehensive although omission of some appropriate European references in favour of North American journals is noticeable. However, particular pleasure was given to this reviewer by the inclusion of a long quotation from an article by Hughlings Jackson on a case of midline cerebellar tumours in the British Medical Journal of 1871! The book is structured on the basis of site orientated chapters covering all aspects of the appropriate malignancies.
