

Although it could be argued that this reduction may simply be the result of reduced life expectancy in MS patients, this is unlikely, as an age-specific Cox survival model also showed a significant reduction in the risk of cancer.<sup>2</sup> Similarly, it is unlikely that this would represent under-reporting of cancer because patients are typically in closer contact with health practitioners than the normal population.<sup>2</sup> Explanations could include lifestyle alterations following diagnosis, genetic factors or immunological changes due to MS. Further study of mechanisms is therefore warranted, but more immediately, the results of this meta-analysis will be of use for MS patients and their care givers.

**Acknowledgements** We would like to thank all members of the Ebers group for helpful discussion and frequent support.

## CORRECTIONS

doi:10.1136/jnnp.2008.169029corr1

J Pretnar-Oblak, M Zaletel, T M Hajnšek, *et al.* Isolated bulbar paralysis in a patient with medullar tau pathology: a case report (*J Neurol Neurosurg Psychiatry* 2010;**81**:847–849). The authors misplaced the label number (9) in Figure 1 of this paper and therefore this area indicated does not represent the nucleus ambiguus. The reprinted version of Figure 1 represents the correct area for nucleus ambiguus.

The authors would also like to explain further the labels in figure 2C and 2D. 2C: Extensive tau pathology in DNVN composed of numerous neuropil threads and tau-positive neurons (arrows). 2D: Tau pathology of few neuropil threads in the SN (arrows).

**Figure 1** The corrected version with previously misplaced number 9.
