

Supplementary Figure 2

Dynamics of NFL levels during the 1st year of DMF in patients with/without disease activity after 0-12 months and 12-24 months treatment with DMF

NFL levels at baseline (BL), and after month 1, 3, 6 and 12 months of DMF treatment are shown in the CSF (**A, C**), plasma (P) and serum (S) (**B, D**) in patients stratified by disease activity during the first 12 months (**A, B**) and second 12 months (**C, D**) of DMF treatment. Mean values and standard deviation (SD) are shown. Activity within the first and second year was defined by relapses and/or enlarging/new white matter lesions on MRI. Filled boxes show NFL levels from patients with disease activity and empty boxes show results from patients with stable disease. DMF = dimethyl fumarate, NFL = Neurofilament light
